

CHAPTER V

AREA AND PRODUCTION OF CROPS AND CROP UTILIZATION

1 INTRODUCTION

Ethiopian farming largely produces only enough food for the peasant holder and his family for consumption, leaving little to sell. This inadequate volume of production is ascribed to the tardy progress in the farming methods and scattered pieces of land holdings. Under this traditional sector, agriculture is practiced on public land and most of the produce is mainly for own consumption. The diverse climate of the country and the multiple utilizations of crops have prompted the vast majority of agricultural holders to grow various temporary and permanent crops. Despite the variation in the volume of production, the relative importance and pattern of growth of these crops are largely similar across many of the regions. This similarity is well observed and demonstrated in the statistical tables presented in this report. In some regions there seems to be a shift in choice of crops grown. Teff, barley and wheat do not figure prominently. Instead, maize, sorghum, Godere & Sweet Potatoes are grown in greater volume than these crops. Gambela, is a case in this regard.

There is a general agreement that the performance of an agricultural system should achieve a steady supply of food to the people of a country. But, unless special attention is focused on agriculture its performance can be impeded by vagaries of nature, population growth and scarcity and fragmentation of land, thus, affecting food supply and posing a challenge to the federal and regional governments. This situation calls for an overhaul of the agricultural system in the country or the regions.

In order to have a flourishing agriculture, which sustains reliable food supply, the federal and regional governments have to formulate and implement farm programs that ensure food security. The preparation, execution, monitoring and assessment of these programs entail statistics on agriculture particularly crop production since it is the prime target that national or regional agricultural policies aim at.

The collection of data on crop production should encompass all crop seasons in the agricultural calendar and farming activities in both rural and urban areas. It should also include the wide range of crops that are grown and embodied in the food security system, which are indispensable for a sustained provision of staple diet and other cash crops like coffee and Chat.

In view of this, crop production data for private peasant holdings for both Meher and Belg seasons in both rural and urban areas were collected in the census to provide the basis for decision making in the process of implementing timely food security measures and to make policy makers aware of the food situation in the country.

Thus, in this chapter the census data on production of temporary crops/annual crops such as cereals, pulses, oilseeds, vegetables and root crops are presented in Section 2. Also production of permanent crops that included fruit crops, stimulant crops and other permanent crops are dealt with in Section 3. Moreover, the utilization of temporary crops as well as permanent crops for various purposes such as household consumption, seed, sale, paying wages in kind ...etc are indicated in Section 4. Furthermore S.E & C.V are provided as an annex to this chapter.

2. PRODUCTION OF TEMPORARY CROPS / ANNUAL CROPS

The types of temporary crops on which data were collected during the census are those that food security embraces: that is, the crops that are the staple diets in the country. In the statistical tables, these crops have been categorized into five groups for simplicity of description and comparison purposes. The groups are cereals, pulses, oilseeds, vegetables and root crops. The crops within each group have some similarity, which made the categorization necessary.

2.1 Cereals

These are crops that are produced in greater volume compared to the other crops because these are the principal staple crops every year and export commodities at times of bumper harvest in the country. *Between the months of September 2001 and August 2002 it was learned that 242,794 quintals of cereals worth 106,028,521 Birr was exported from Ethiopia to various countries. Cereals are grown in almost all regions of Ethiopia with notable variation in the extent of areas planted and the volume of production obtained. This variation is seemingly caused by a shift in choice of crops by the holders and difference in weather conditions. Summary Tables V.1 and V.2 reinforce this thought further by giving a highlight on the size of area planted to maize, sorghum and godere and volume of production of these crops harvested in Gambela region when compared to Teff, barley & wheat produced in the same region.

Summary Tables V-1 and V-2 show that 94.73% of the regional grain crop area was devoted to cereals and 98.55% of the grain production was that of cereals. Out of all area under grain, Maize and sorghum took up

*Source:- Ethiopian Customs Authority

69.89%, 23.9% maize and sorghum yield was 76.96% and 20.95% of the

regional grain production. The area planted to grains and the production acquired in Belg season were 24.99% and 8.98% of the total grain crop area and grain production of the region, respectively. Of the regional area under cereals, 25.21% was cropped in Belg season and 8.88% of the cereal production is achieved in the same season.

As the census result depicts, agricultural households in urban areas of the region contributed 3.43% and 3.06% of the regional grain crop area and grain production, respectively. Out of the total area under cereals and production, 3.42 % and 2.89 % were added by urban agricultural households, in the same order. The pattern of the principal crops is the same for both rural and urban holders.

A look at the zonal tables helps to note that zona 1 and zone 2 shared 22.82% and 77.18 of the total regional crop area, respectively. The zonal contributions to the regional production were 20.28, and 79.72% for zone 1 and zone 2 in the same order. The zones made up 23.03 and 76.97% of the regional area under grain crops and 20.62% and 79.38% of the regional grain production, in the that order. Summary Tables V-3 and V-4 indicate that 96.95% of the zonal grain crop area was under cereals and 98.13% of the production was made up of the same crops in zone 1. Maize & Sorghum which accounted for 91.31% and 5.52% of the area under grains, were the major crops in the zone respectively. The zonal grain production was composed of 91.82% Maize and 6.05% Sorghum. The area planted in Belg season was 20.94% of the Zonal area under grain crops.

Agricultural holders in urban areas added 8.05% and 8.14% to the zonal crop area and production, in that order. Urban holders took up 8.1% of the area under grain crops and 9.39% of the grain production in the zone. Maize, Groundnuts and Sorghum were the principal crops in terms of both area planted and production obtained.

Summary Tables V-5 and V-6 show that 94.07% of the grain crop area was under cereals and 98.66% of the grain production was drawn from these crops in zone 2. Maize and Sorghum were the major cereal crops in the zone accounting for 63.48% and 29.4% of the zonal area under grain crops and 73.11% and 24.82 of the zonal grain production, respectively, of the zonal crop area and production, Belg season tookup 25.49% and 10.04% in the order. Out of the area under grain crops, 26.24% was cropped and 11.04% of the cereal production was drawn in Belg season.

The agricultural holders in urban areas added 1.97% of the crop area and 1.17% of the production to the zonal total. Urban holders also contributed 2.04% of the area under grain crops and 1.41% of the grain production to the zonal amount. Sorghum and maize were the major crops produced by urban holders in the zone in terms of volume of production.

2.2 Pulses

These crops are essential part of the dietary requirements for most Ethiopians. These crops also form a significant commodity group of export, earning a considerable amount of foreign exchange for the country and cash for peasant farmers. * In 2001/02 (1994) E.C, between the months of September and August, 1,229,366 quintals of pulses valued at 351,997,759 Birr was exported from Ethiopia to various countries. These are some of the grounds for growing various pulses in all regions of the country with varying quantities. There is no doubt that economic benefits can accrue to the country from the production and export of more pulses if the agriculture in Ethiopia is given due attention in this regard.

*Source:- Ethiopian Customs Authority

A view of Summary Tables V-1 and V-2 enables to detect that only 1.93% of the regional grain crop area was under pulses and 0.67% of the grain production consisted of the same crops. Of the regional area under grain

crops, 1.9% was planted to haricot beans. The production obtained from haricot beans was only 0.67% fo the regional grain total.

Summary Tables V-3 to V-6 consecutively explain that the zonal contributions to the regional area and production of grain crops were 0.41% and 0.15% by zone 1 and 1.52% and 0.52% by zone 2 in that order. In zone 1, 1.77% of the grain crop area and 0.71% of the grain production were that of pulses. In this zone haricot beans was the major pulse, which took up 1.77% of the area under grain crop. Thus, the principal crops in terms of volume of production was haricot beans, that formed 0.71% of the zonal production of grains. The census results, as presented in these tables, indicate urban hodlers in Zone 1 planted only 0.37% of the zonal area under grain crops to pulses. Among the pulses, haricot beans, was the major pulse produced by urban holders in the same zone which made up 0.37% of the zonal area under grain crops.

In zone 2, 1.98% of the grain crop area was under pulses and 0.66% of the zonal grain production was drawn from these crops. The major pulses in terms of area in the zone was haricot beans, which shared 1.94% of the area under grain crops in the zone. Haricot beans contributed 0.65% to the zonal grain production. Of the total area under grains and volume of grain production in this zone, only 1.2% of the zonal area under grains was planted to pulses in Belg season. It should be noted that the total contribution of area of the zone comes mainly from haricot beans.

2.3 Oilseeds

These crops are also of paramount importance as a source of cooking oil used to provide the fat required in the food consumed by the residents in the region. Moreover, oil crops have become a major commodity of export earning a great

deal of foreign exchange. * Between September 2001 and August 2002, Ethiopia exported 953,088 quintals of oilseeds valued at 351,952,634 Birr signaling that an increase in the production and export of these crops will definitely generate more money.

Summary Tables V-1 and V-2 indicate that only 3.34% of the regional grain crop area was under oilseeds and 0.78% of the regional grain production was that of the oil seeds. Of the total area under grain crops and grain production in Gambela Region, 2.92% went for sesame. Urban holders planted 0.19% of the grain crop area to oil crops and obtained 0.19% of the grain production from oil crops. Sesame grown by urban holders accounted for 0.04% of the regional area under grain crops.

Summary Tables V-3 and V-6 indicate that zone 1 and zone 2 contributed 0.29% and 3.39% to the area under grain crops and 3.04% and 0.55% to the grain production with oilseeds in the region, respectively. As shown in Tables V-3 and V-4 in zone 1, 1.28% of the zonal grain crop area and 1.16% of the volume of grain production were that of oilseeds. Out of the zonal area under grain crops, Groundnuts and sesame took up 0.75% and 0.41%, respectively. The same crops made up 0.95% and 0.19% of the zonal grain production, in that order. Urban holders augmented the zonal area and production of grain crops by 0.81% and 1.16% with oilseeds, respectively. The tables also show that 0.62% and 0.17% of the zonal grain area were under groundnuts and sesame planted by urban holders, in that order. The same holders

*Source:- Ethiopian Customs Authority

produced groundnuts and sesame formed 0.84% and 0.3% of the zonal grain production, respectively.

In zone 2, 3.95% of the zonal grain crop area was under oilseeds and 0.69% of the total volume of grain production in the zone was drawn from the same

crops. Of all the zonal area under grain crops, 3.67% was that of sesame. The volume of production of this crop was 0.57% of the zonal total grain production.

2.4 Vegetables

These crops like fruits are also a good source of nourishment necessary for the healthy growth of humans. Dieticians often advise people to eat more of vegetables for their nutritional values. Vegetables are relatively cheaper and better available than other farm products in urban centers because these crops are usually grown as garden produces sometimes using irrigation. It may be worth to know that a certain amount of foreign exchange is drawn from vegetable exports.* For instance between September 2001 - August 2002 Ethiopia exported 61,070

quintals of vegetables worth 11,543,144 Birr to various countries. Thus, on the grounds that vegetables are nutritionally and economically important, it is worth expanding vegetable farming. When one looks at Summary Tables V-1 – V-2 to have a picture of the vegetable production in Gambela region one realizes that a lot has to be done in this regard.

Summary Tables V-1 and V-2 show that only 0.57 % of the regional crop area is under vegetables which formed 2.89 % of the total volume of production in the region. Ethiopian cabbage took up 0.26 % of the regional crop area and the same crop made up 1.82 % of the vegetable

*Source:- Ethiopian Custom Authority

production of the region. The contribution of vegetables to the regional production by urban holders was only 0.04%.

Summary Tables V-3 to V-6 show that zone 1 and zone 2 formed 10.32% and 89.68% of the regional area under vegetables and 11.54% and 88.46% of the

regional vegetable production, in that order. In zone 1 0.26% of the zonal crop area and 1.95% of the production in the zone were that of vegetables. Tomatoes covered 85.83% of the zonal area under vegetables.

In zone 2, 0.66% of the zonal crop area and 3.2% of the production were that of vegetables. Ethiopian cabbage and red peppers were planted in 50.18% and 33.03% of the zonal area under vegetables, respectively. Thus Ethiopian cabbage and red peppers yielded 70.52%, and 5.96% of the zonal volume of vegetable production, in that order.

2.5 Root Crops

Some root crops like onion and garlic are indispensable part of the daily meal of the Ethiopian population. These crops are essential to improve the taste and scent of the food. Potato, which is one of nature's precious gifts, is also very common in the dishes of most Ethiopians. This importance necessitated the growth and production of many of the root crops throughout the year often via the use of irrigation. Root crops are also a good source of cash and foreign exchange for the growers and the country, respectively. * In 2001/02 (1994 E.C), the country has acquired a sum of 22,423,972 million Birr by exporting 120,497 quintals of root crops. The economic and nutritional importance of root crops has been a factor for practicing the agriculture in all the regions and growing the crops more than one time in a year.

Summary Tables V-1 and V-2 indicate the root crop situation in Gambela Region. As the tables show, root crops covered only 2.89 % of

*Source:- Ethiopian Customs Authority

the regional crop area and 14.41 % of the production volume. Godere

and sweet potatoes shared 1.92 % and 0.93 % of the regional root crop area and these crops added 8.83 % and 5.4% to the regional volume of root crop production respectively.

3. PRODUCTION OF PERMANENT CROPS

Permanent crops are long term crops that occupy the field planted for a long period of time and largely harvested every year and do not have to be replanted for several years after each harvest. These include tree crops such as coffee, Enset, Chat, oranges, mangoes, bananas, papayas, avocados... etc. The trees that yield fruits like oranges; mangoes, papayas, apples and others are also known as fruit trees.

Permanent crops are a good source of cash both for the holders and the country generating handsome income and foreign exchange at the best of times. For instance, between September 2001 and August 2002 Ethiopia exported 53,142 quintals of fruits and nuts and 91,705 quintals of Chat valued at 16.5 and 426.7 million Birr, respectively. (CSA, External Trade Statistics)

With these bits of information and the dietary and economic importance of the crops in mind, it is not difficult to project the profits that can be reaped from the permanent crops if the farming in this regard is well developed and managed.

Fruits are not only a source of cash but are also a reliable source of nutrition that is essential for the health and growth of humans. There has even been an oft-repeated advice from health authorities that we should include fruits in our daily dish to make it nutritious. The two points made on the importance of permanent crops underscore the fact that fruit farming should be encouraged and expanded to have a steady supply of the desired products.

It is possible to conjecture that permanent crops in Ethiopia are not as well developed as they are in other countries. But the potential to develop them is great as Ethiopia is blessed with diverse climate conducive to the crops. In order to direct efforts towards the development of permanent crops, one requires statistical data regarding this sector

of the agriculture. Adequate data on type and volume of production, area under permanent crops and their distribution have not been available. Hence, to bridge up this gap and alleviate the chagrin to data users the CSA has collected data on permanent crops.

Prior to the census, the CSA surveyed the situation about permanent crops in the country and then decided on the types of permanent crops, range of data items and method of enumeration to be included in the census. Hence, only major permanent crops were covered during the census. Data on the types of crops were collected by holder interview while area and yield data were recorded by objective measurements. The numbers of Enset, Hops (Gesho) and fruit trees with the exception of pineapple were determined by counting the plants excluding seedlings.

In estimating the production of permanent crops, area, yield per unit area, yield per tree and number of fruit bearing trees are essential ingredients. These inputs were determined by physically measuring the area under crops in question, picking fruits, coffee berries and Chat produce from randomly demarcated plots or selected trees. The method involved crop cutting from small plots of rectangular shape of different sizes randomly placed in the selected crop field and a tree of fruit bearing age selected from all fruit bearing trees for each crop type and subsequent husking, drying weighing and recording the weight of the harvest of permanent crops. The crop cutting was performed for a sub sample of 20 households of the 30 households selected in each enumeration area. A 4m X 4m plot was demarcated for coffee and Chat and a 2m X 2m for pineapple and 1m X 1m plot for sugar cane were designated for the crop cutting exercise. The yields harvested from these plots and trees were immediately weighed (green weight) and/or weighed again after two weeks of drying to conform to the normal holder harvesting and drying practices. The coffee weight registered was that of clean coffee beans and the hops (Gesho) weight taken was that of the dry one. The green and dry weights were recorded on the appropriate forms. For simplicity of description of the statistical tables and comparison purposes permanent crops have been grouped into three categories. Each category has a

semblance of similarity, which necessitated the categorization. The categories are fruit crops, stimulant crops and other permanent crops. These categories include only permanent crops on which yield data have been collected.

3.1. Fruit Crops

Various kinds of fruit crops grow in different regions of the country yielding varying quantities of fruits within the private peasant holdings in the traditional way. There are also a few fruit farms that are run by enterprises in the modern way. The volume of fruit production obtained from the peasant farms is small signalling the absence of development in fruit farming. A look at the tables helps to crystallize this point.

As summary table V-7 shows in Gambela Region about 3.7 thousand hectares of land is under permanent crops in the region. Fruit crops constituted 9.8% of the permanent crop area yielding about 34.3 thousand quintals of fruits. Bananas, Mangoes and Papayas shared 49.56%, 29.38 % and 14.39 % of the fruit crop area and 26.17%, 25.52% and 45.66% of the fruit production, in that order. Urban agricultural holders added 12.67 % to the regional permanent crop area. Mangoes & Papayas constituted 41.3% and 25.63% of the urban fruit area. The same holders, in that order contributed about 10.36 % and 68.95 of the urban fruit crop production. Mangoes and Papayas grown by urban holders accounted for 0.98 % and 0.61% of the area under fruit crops and 0.63% and 4.17% of the of the fruit production in the region, respectively. For details, refer to Summary Table V-7.

A glimpse of Tables V-8-V-9 gives a picture about the zonal contributions to the regional total of permanent crop area and production. Zone 1 and Zone 2 made up 3.38% and 96.62% of the regional permanent crop area, respectively. This resulted in 34.97% and 65.03% of the fruit crop production in the region, in that order. In Zone 1 127 hectares of land is under permanent crops of which 99.12% is under fruit crops with a recorded production of about 11,985 quintals of fruits. Thus, mangoes and Bananas took up 48.26% and 40.55% of the zonal fruit crop area resulting in 47.59% and 29.55% of the fruit crop production, in that order. Urban holders in the zone added 3.89% to the zonal permanent crop area and 3.90% and 3.36% of the Zonal fruit production. Papayas grown by urban

holders took up 1.61% of the zonal fruit crop area and Mangoes covered 1.2% of the zonal fruit production. Details are given in summary Table V-8.

In Zone 2,3,633 hectares of land is under permanent crops of which 6.68% is under fruit crops. More than 22,000 quintals of fruits was produced in the zone in 2001/02 (1994 E.E.) Bananas, Mangoes and Papayas constituted 54.22%, 19.61% and 16.74% of the zonal fruit crop area and 24.35%, 13.65 and 58.07% of the fruit production, in that order. Urban holders in the zone added 12.98% of the zonal permanent crop area and 1.58% of the fruit crop area. The fruit production contributed by urban holders was 7.48% of the zonal total fruit production. Mangoes grown by urban holders made up 57.18% of the urban fruit crop area and 4.24% of the urban fruit production in the zone, respectively. See the details in summary Table V-9.

3.2. Stimulant Crops:

This category embraces cash crops like coffee and Chat, which are extensively grown in many parts of the country. It is needless work to verify by quoting statistical evidences that coffee is a major foreign exchange earner. It may not be even surprising to hear that Chat farming is becoming a rapidly expanding phenomenon in Ethiopia because of its economic importance. As the census covered a wide range of crops, the statistics on Chat would perhaps be more tantalizing than the others. Summary Table V-7 shows the situation in which coffee & Hops are found in Gambela Region.

The data in the table demonstrates, more than three fourth ie, 77.81 % of the regional permanent crop area is under stimulant crops. Of the total area under stimulant crops in the region, 98.22 % is that of coffee resulting in 90.4 % of the volume of stimulant crop production. Coffee grown by urban holders accounted for 15.8 % of the stimulant crop area and 7.27 % of the production in the region.

Tables V-8 and V-9 portray that almost all of made up the stimulant crop area and production is found in zone 2. In Zone 2, 80.53% of the zonal permanent crop area was under stimulant crops. Of the zonal stimulant crop area 98.22% was under Coffee. Coffee constituted 90.4% of the production of stimulant crops. Coffee grown by urban holders in the zone shared 15.80% of the zonal stimulant crop area.

3.3 Other Permanent Crops

This group includes Enset and Sugar cane on which yield data have been collected. Enset is a principal staple crop extensively grown in S.N.N.P. and Oromiya Regions. The growers draw a substantial amount of money from the sale of Enset products. Though, sugar cane is an industrial crop it looks that it is not widely practiced by the private peasant holders, as the statistics seem to indicate. It is produced on a small scale by private peasant holders in some pockets of the country and usually does not end up in sugar cane processing plants. The sugar factories in Ethiopia run extensive Sugar cane plantations. As the statistics indicate 660,146 quintals of sugar worth 111,773,918 birr was exported between September 2001 and August 2002.(CSA,External Trade Statistics)

Summary Table V-7 sheds some light on the production of Sugar cane in Gambela Region. Both crops covered 12.39% of the regional permanent crop area. Of the regional area under other permanent crops Enset took up 84.36% of it. The result also indicates that more than 5000 quintals of sugar cane were produced in the region. About 21.14% of other permanent crop area in the region is under sugar cane grown by urban holders.

Summary Tables V-8 and V-9 show the zonal contribution of other permanent crops to the regional total of the same crops. As shown in these tables, Zone 1 and zone 2 zones constituted 0.28% and 99.72% of other permanent crop area in the region, respectively. Zone 2, contributed 99.32% of the regional sugar cane production. More than 5000 quintals of sugar cane was produced in Zone 2.

4. Crop Utilization

Agriculture is the livelihood of the overwhelming majority of the Ethiopians. It is the source of food and cash for those who are engaged in it and others. Most agricultural holders acquire the food they eat and the cash they need to cover other expenses only from farming activities. Since farming in Ethiopia is often precarious and usually at the mercy of nature, it is invariably an arduous struggle for the holders to make ends meet. This, it often transpires, is true to the frequent shortfalls in the volume of production that occur in the country.

It is often said that what most Ethiopian agricultural holders produce is only enough to live, hand to mouth. This would be better said if it was statistically substantiated. There is plenty of information on the volume of crops produced within the private peasant holdings. But there is hardly any information on how the peasants utilize the crops they produce which will be indicative of the fact whether the holders have enough or little to sell in order to meet other expenses for living. For use in the census taking, crop utilization was defined as the amount of agricultural produce used for own consumption, sale, seed, and wages in kind, animal feed and other purposes.

In light of this information gap, the CSA has collected some data on how holders use their agricultural produce in the agricultural year to provide some information on the subject. The data were collected by interviewing the holders. They were asked to quantify their yearly crop utilization experience in percent based on common practice. Summary Tables V-10 to V-12 convey this information to shed some light on how holders utilize their crop produce. Information was sought for each crop type produced during the census year. The resulting data may help users to have some idea about crop usages by agricultural holders. In order to detect the differences in utilization of the various crops, it is better to look into the data by group of crops as categorized in the summary tables for simplicity and analogy.

Needless to say, as Summary Table V-10 points out, most of the cereal crops produced were used for household consumption. In Gambela Region 75 % of the cereals produced were used for household consumption. About 13 % and 8 % were used for

sale and seed, respectively. The remaining 4 % of the cereals produced was used for other purposes like wages, animal feed, etc. When the utilization is considered by crop type, it is easy to realize that between 68 % and 91 % of the crops in the cereals group were used for own consumption and between 8 % and 16 % of these crops were used for sale. Moreover, between 5 % and 16 % of the same crops in the same group were used for seed.

As shown in Summary Table V-10 about 83 % of pulses were used for household consumption, 10% were used for sale and 5% for seed. The remaining 2 % of pulses were used for wages, animal feed and others. Considering utilization by crop type within the pulses group, 83% of the crops were utilized for household consumption and 5% of the same crops in the same group were sold in 2001/02 (1994 E.C.). Moreover, 5 % of these crops in the pulses group were also used for seed in the same year.

Eventhough, the patternof utilization of Oilseeds seem the same more percentage of oilseeds were sold as portrayed in Summary Table V-10. About 52 %, 38 % and 7 % were used for household consumption sale and seed, respectively. Taking utilization by crop type into account, between 29% and 100% of each crop type in the oilseeds category were used for household consumption, between 14-62% for sale and 7% for seed. It may reasonably be summed up that more of the oilseeds produced are used for household consumption.

About 82% and 14% of the vegetables produced were used for household consumption and sale, respectively. The remaining percent were used for seed, wages, animal feed and others. The percent used by crop type with in the vegetables group were between 62%-91% for household consumption, between 7%-28% for sale, between and 1%-2% were used for seed. For details, refer to Summary Table V-10.

The utilization of root crop production is the same as that of vegetables as indicated in the regional Summary Table V-10. About 87 % of the root crops were used for household consumption 6% used for sale and 5% for seed. The ranges of percent

utilized by crop type within the root crops category fall between 67%-100% for consumption, 4%-13% for sale.

The pattern of the permanent crop utilization is different from that of cereals, pulses, vegetables and root crops. Thus, about 54 % of the crop was used for consumption at home and about 39% for sale. The utilization by crop type within the permanent crop group ranges between 16% and 79% for household consumption and between 14% and 78% for sale. Permanent crops are also used as cash crops like oilseeds. It is rational to conclude by looking at Summary Table V.10 that the peasant farmers consume more of what they produce leaving little to sale.

Summary Table V-11 and V-12 indicates that the pattern of crop utilization in the zones is similar to that of the region. In Zone 1, the percent of cereals used were 74% for household consumption, 3 % for sale and 8 % for seed. Crop utilization in the zone for each crop in the cereal category ranged between 75% and 76% for household consumption, 12% for sale and 8% - 9% for seed.

The utilization of pulses in the zone is about the same as cereals. About 72% of the pulses produced were used for household consumption, 17% for sale and 7% for seed. The remaining 4% were used for other purposes. The percent of pulses used by crop type in the pulses was 72% for household consumption, 17% for sale and 7% for seed.

In Zone 1 about 52% of the oilseeds grown in the zone were used for consumption at home, 36% for sale and 9% for seed. The usage of oilseeds by crop type within the category ranged from 50%-56% for household consumption, 28% - 41% for sale and 7% - 11% for seed.

In zone 1 about 58% of the vegetables produced were sold, and about 35% were used for household consumption, and seed, respectively. The utilization of each crop in the vegetable group varied from 57% to 63% for sale, 25%-37% for household consumption.

The data in Summary Table V-11 shows that most of the root crops produced in the zone were used for household consumption. More than 75 % of the root crops were consumed at home, about 16 % used for sale and 2 % for seed. The utilization by crop type within this group fluctuated from 69% to 75% for household consumption, 16%-27% for sale and 2% for seed.

Permanent crops formed the second group used as a source of cash after oil seeds. As indicated in Summary Table V-11, about 47% of the permanent crops were used for sale and 46% for own consumption. The percent of usage of each permanent crop within the group varied between 28% and 58% for sale and 37%-100% for consumption at home.

In Zone 2, the product utilization pattern is the same as the region and the other zones. The census result reveals that about 75 % of cereals were used for household consumption, 12% for sale and about 7% for seed. The percent of utilization of each crop in the cereal category ranged between 75% and 91% for household consumption, 8 - 16% for sale and 5 - 16% for seed.

Concerning pulses about 92% of the pulses were used for household consumption, 4% for sale and 3% for seed. The percent of utilization by crop type within the pulses category were 92% for household consumption, 4% for sale and 3% for seed.

The data on oil seeds utilization in Zone 2, have the same trend as that of the region and Zone 1. As shown in Summary Table V-12, about 52% of the oil seeds were consumed 39% for sale and 7% for seed. The percent utilized by crop type within the oil seed category fall between 27 -100% for 10 - 66% for sale and 7%-8% for seed.

As mentioned earlier data on the pattern of crop utilization of vegetables and root crops was collected. The result shows that about 85% of the vegetables grown were used for household consumption and 12% for sale. The percent utilized by crop type in

the vegetable category varied from 62% - 94% for household consumption and 5 - 20% for sale in Zone 2.

In zone 2 the data show that about 89% of the root crops were used for household consumption and 5% for seed and 4% for sale. The percent utilized by crop type within the group fluctuated from 67 - 100% for household consumption and 1 - 21% for seed and 4%-12% for sale.

For Zone 2, permanent crops are also second to oilseeds as a source of cash as portrayed in Summary Table V-12. Thus, about 56% of permanent crops grown in the zone were used for household consumption and 37% for sale. The percent utilized by crop type within the permanent crops group fall between 16 - 85% for household consumption and 9% - 78% for sale.
